Reviews for JScripator - You can use it in a browser to write JavaScript codes directly, you can also use it to write Javascript codes in a local editor. - However, there are some of the bugs or glitches like Javascript syntax error or there are some places which are hard to enter some values. - I don't like it so much because if you want to write some PHP codes which are complex to write, it won't be easy to write them. - Also, you have to install Jscripator to write some scripts, also, there are some bugs like the link button should not be in the same div. 2. The highlighting is quite bad.
3. The script editor does not support error-checking and does not give you meaningful errors.
4. It's not even completely clear what the
